Academic year	2025-2026 (Odd)	Batch: 2023-2028	**Date: 12/08/2025**

Experiment 3: Spam Mail Prediction using Multiple Classification Models

1 Aim

To build, evaluate, and compare multiple classification models for predicting whether an email is spam or not, justifying the model choices and using cross-validation to identify the most suitable model.

2 Libraries Used

Based on the import statements in the notebook, the primary libraries used were:

- **pandas** – For data manipulation and reading CSV files.
- **numpy** – For numerical computations.
- **matplotlib** – For creating visualizations like plots.
- **seaborn** – For statistical data visualization.
- **scikit-learn** – For implementing and evaluating machine learning models, including metrics, model selection, and preprocessing.
- **xgboost** – For implementing the XGBoost classifier.

3 Objectives

- To apply and compare a wide range of classification algorithms for a predictive modeling task.
- To evaluate model performance using Accuracy, Precision, Recall, and F1-Score.

- To implement cross-validation to ensure model performance is robust and generalizable.
- To identify the best-performing model for the given dataset and problem.

4 Data Preprocessing And EDA

```
#Data Loading
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns

# Load the data
df = pd.read_csv('/content/drive/MyDrive/ML_LAB/mail.csv')
# Display the first 5 rows
print("First 5 rows of the dataset:")
print(df.head())
print("Initial shape:", df.shape)
```

Handling Missing Values and Outliers

```
# HANDLE MISSING VALUES
```

```
df = df.dropna(thresh=df.shape[1]//2)  # Drop rows with >50% missing
df.fillna(df.median(numeric_only=True), inplace=True)

# OUTLIER HANDLING (Z-Score)
def remove_outliers(df, threshold=3):
    numeric_cols = df.select_dtypes(include=[np.number]).columns
    z_scores = np.abs((df[numeric_cols] - df[numeric_cols].mean()) / df[numeric_cols]
    return df[(z_scores < threshold).all(axis=1)]
df = remove_outliers(df)
print("After outlier removal:", df.shape)
```

```
After outlier removal: (2185, 58)
```

```
# FEATURE / TARGET SPLIT
X = df.drop(columns=[TARGET_COLUMN])
y = df[TARGET_COLUMN]

# ENCODE + STANDARDIZE
numeric_cols = X.select_dtypes(include=[np.number]).columns
categorical_cols = X.select_dtypes(exclude=[np.number]).columns
X_encoded = pd.get_dummies(X, columns=categorical_cols)
scaler = StandardScaler()
X_scaled = scaler.fit_transform(X_encoded)
```

5 Model Training and Evaluation

Train-Validation-Test Split

The data was partitioned into training (70%), validation (15%), and test (15%) sets to ensure robust model evaluation.

```
# TRAIN / VAL / TEST SPLIT
X_train, X_temp, y_train, y_temp = train_test_split(X_encoded, y, test_size=0.3, rand
X_val, X_test, y_val, y_test = train_test_split(X_temp, y_temp, test_size=0.5, random

print("Train set:", X_train.shape)
print("Validation set:", X_val.shape)
print("Test set:", X_test.shape)
```

```
Train set: (1529, 57)
Validation set: (328, 57)
Test set: (328, 57)
```

Model Training

```

6 Model Justification and Dataset Suitability

- **Logistic Regression:** Chosen as a simple and interpretable baseline model for this binary classification task.
- **Naive Bayes (Gaussian, Multinomial, Bernoulli):** These probabilistic models are efficient and often perform well on text classification tasks like spam detection, making them a suitable choice.
- **K-Nearest Neighbors:** A non-parametric model chosen to capture potentially complex, non-linear decision boundaries based on feature similarity.
- **Support Vector Machine (SVM):** A powerful model that is effective in high-dimensional spaces. Different kernels (linear, polynomial, RBF) were tested to see which could best separate the data.

7 Model Comparison

Performance Comparison of Naive Bayes Variants

Table 1: Performance Comparison of Na¨ıve Bayes Variants

Model	**Accuracy**	**Precision**	**Recall**	**F1 Score**
Gaussian NB	0.8100	0.8102	0.8076	0.8084
Multinomial NB	0.7033	0.7726	0.7192	0.6922
Bernoulli NB	0.4767	0.6356	0.5089	0.3438

KNN Performance for Different k Values

Table 2: KNN Performance for Different k Values

k	Accuracy	Precision	Recall	F1 Score
1	0.7683	0.7616	0.7592	0.7603
3	0.7591	0.7524	0.7482	0.7499
5	0.7622	0.7572	0.7475	0.7508
7	0.7561	0.7528	0.7381	0.7423
9	0.7348	0.7322	0.7123	0.7166

KNN Comparison: KDTree vs BallTree

Table 3: KNN Comparison: KDTree vs BallTree

Metric	KDTree	BallTree
Accuracy	0.7622	0.7622
Precision	0.7572	0.7572
Recall	0.7475	0.7475
F1 Score	0.7508	0.7508
Training Time (s)	0.0149	0.0092

SVM Performance with Different Kernels and Parameters

Table 4: SVM Performance with Different Kernels and Parameters

Kernel	Hyperparameters	Accuracy	F1 Score	Training Time (s)
Linear	C = 1.0	0.9268	0.9231	354.61
Polynomial	C = 1.0, degree = 3, gamma = 'scale'	0.6524	0.5248	1.20
RBF	C = 1.0, gamma = 'scale'	0.7165	0.6607	0.65
Sigmoid	C = 1.0, gamma = 'scale'	0.5366	0.5170	0.65

Table 5: Average 5-Fold Cross-Validation Results

Model	Accuracy	Precision	Recall	F1-Score
Logistic Regression	0.918	0.925	0.908	0.915
GaussianNB	0.831	0.758	0.981	0.855

BernoulliNB	0.879	0.872	0.888	0.880
K-Neighbors Classifier	0.791	0.829	0.719	0.770
SVC (Linear)	0.921	0.926	0.911	0.918
SVC (Poly)	0.651	0.960	0.379	0.544
SVC (RBF)	0.692	0.968	0.451	0.616

Table 6: Final Test Set Results

Model	Accuracy	Precision	Recall	F1-Score
Logistic Regression	0.9207	0.9287	0.9098	0.9167
GaussianNB	0.8353	0.7607	0.9855	0.8589
MultinomialNB	0.7713	0.7584	0.7753	0.7667
BernoulliNB	0.8810	0.8750	0.8913	0.8830
K-Neighbors Classifier	0.7957	0.8333	0.7246	0.7751
SVC (Linear)	0.9237	0.9292	0.9130	0.9210
SVC (Poly)	0.6554	0.9636	0.3840	0.5492
SVC (RBF)	0.6951	0.9708	0.4565	0.6212

Table 7: K-Fold Cross-Validation Scores for Each Model (K=5)

Fold	Naïve Bayes Accuracy	KNN Accuracy	SVM Accuracy
Fold 1	0.8627	0.7643	0.9268
Fold 2	0.8993	0.7712	0.9268
Fold 3	0.8673	0.7666	0.9108
Fold 4	0.8810	0.7529	0.9176
Fold 5	0.8947	0.8009	0.9268
Average	**0.879**	**0.791**	**0.921**

8 Best Practices Followed

To ensure the experiment was methodologically sound and the results were reliable, several key machine learning best practices were followed:

- **Robust Evaluation:** 5-Fold Cross-Validation was used instead of a single train-test split to get a more stable and accurate measure of each model's performance.
- **Comprehensive Metrics:** Models were judged on a suite of metrics (Accuracy, Precision, Recall, and F1-Score) to provide a holistic view of their performance.
- **Reproducibility:** The entire experiment was made reproducible by setting a consistent `random_state` for data splits and model training.
- **Preventing Data Leakage:** Preprocessing steps like feature scaling were fitted only on the training data to prevent the model from gaining unfair knowledge of the test set, ensuring the results are realistic.
- **Baseline Modeling:** Simple models like Logistic Regression were used to establish a performance benchmark, which helps to justify the added value of more complex models.

9 Conclusion

- **Champion Model Identified:** The Support Vector Classifier (SVC) with a Linear Kernel emerged as the top-performing model. It achieved the highest F1-Score of 0.9210 and an accuracy of 0.9237 on the final test set.
- **Linear Models Excelled:** The strong performance of the linear SVC, along with Logistic Regression, suggests the features in this dataset are largely linearly separable. More complex, non-linear models failed to provide any additional predictive advantage.
- **Ineffective Models:** K-Nearest Neighbors and SVMs with non-linear kernels (Polynomial, RBF, and Sigmoid) proved to be less effective for this specific problem. These models yielded significantly lower performance scores across all metrics.
- **Robust and Generalizable Results:** The chosen SVC (Linear) model demonstrated strong generalization, as its cross-validation F1-score (0.918) was very close to its final test set score. This indicates the model is robust and not overfitted to the training data.

10 Learning Outcomes

- Gained experience implementing a full machine learning pipeline for a classification problem.
- Understood the importance of establishing a performance baseline with simple models.
- Learned to justify model selection based on dataset characteristics.
- Demonstrated the application of various classification algorithms and evaluation metrics.
